

Dillon Guthrie, Samuel Rios-Lazo

CSE 270

MR. Briggs

6/14/2023

Scenario 1: Time is 1:10 seconds Samuel's responses were both great 5 for experience and 5 for difficulty very easy and loved the experience.

Scenario 2: Time is 1:52 Samuel's response was a 2 and the satisfaction is a 3 one thing have the www work for the assignment or have it fixed by specifying what to put in the URL.

Scenario 3: Time is 2:53 since because he had to do it twice 2 for experience and 2 for difficulty.

Samuel worked on a cell phone. It works the same for usability and its not faster we also ran into the same problems. The success will be able to use the URL website turning it in having the bug not fixed but a minor bug to be fixed using www instead of https. Another success is how easy it is to fill out and less time-consuming. The failure is that of not being able to go back and edit data without it submitting the form. These are the bugs that need to be fixed with going back and review the next step without submitting the form.

Besides those two bugs the system runs as it should but would be beneficial to consumers to really be able to go back and edit information. Samuel was using an I-phone and using safari to do the tests having no problems of running the test on safari. This is our test findings of how we run the test whether it would work the same. The conclusion of this report is that you will have the same test problems whether on a computer or cell phone.
